Short title Deuterium and C-13 labelled O^6^-carboxymethyl-2’-deoxyguanosine

Abstract
The adduct O^6^-carboxymethyl-2’-deoxyguanosine (O^6^CMdG) is of importance as it has been previously linked to a high red meat diet in humans and, as yet, a LC-MS method has not been developed due to lack of appropriate standards. The synthesis of the deuterated and C-13 analogues required the use of \([^{2}H_2]\)- and \([^{13}C_2]\)ethyl glycolate to label the carboxymethyl moiety of O^6^CMdG. \([^{2}H_2]\)Ethyl glycolate was synthesised via acid hydrolysis of ethyl diazoacetate using deuterated solvents (59% yield), whilst \([^{13}C_2]\)ethyl glycolate was synthesised from \([^{13}C_2]\)glycine in a three step procedure (35% yield). The labelled ethyl glycolates were then used to synthesise \([^{2}H_2]\)- and \([^{13}C_2]\)O^6^CMdG for future use as internal standards in the LC-MS analysis of biological samples.

Keywords stable labelled synthesis, C-13, H-2, O^6^-carboxymethyl-2’-deoxyguanosine, O^6^CMdG, ethyl glycolate, LC-MS

Introduction
Cancer is a disease that afflicts approximately one-third of the global population at some point in their lifetimes. Consequently, there is a vast quantity of research into the mechanisms and prevention of cancer, and differences have been found according to geographical regions which has been linked to a numbers of factors including diet\(^{[1]}\). Mutagenic and carcinogenic compounds arise from many exogenous and endogenous routes, including diet, and may result in chemical modifications to the DNA structure, i.e. DNA adducts. One such adduct is O^6^-carboxymethyl-2’-deoxyguanosine (O^6^CMdG) that has been linked to nitrosated amines from red meat diets\(^{[2]}\). Previous research has examined this adduct using an immunoslot blot assay which is very sensitive but only a single adduct can be analysed at a time and difficulties can occur due to cross-reactivity of the antibodies\(^{[3, 4]}\). A limited supply of a polyclonal antibody does exist for O^6^CMdG but attempts to produce a monoclonal antibody have been unsuccessful and a different technique will therefore be needed in the future. There has been considerable progress in the area of DNA adduct analysis by LC-MS and good sensitivity can be achieved\(^{[5]}\). Hence, we pursued the use of LC-MS as a more selective, and potentially sensitive, technique to analyse DNA adducts in biological samples. The synthesis of unlabelled O^6^CMdG, 1 (Scheme 1), has been reported by other researchers\(^{[6]}\) where methyl glycolate was used to furnish the carboxymethyl group at the O6 position of 2’-deoxyguanosine. However, we utilized ethyl glycolate due to the availability of starting materials to insert the labelled atoms for \([^{2}H_2]\)- and \([^{13}C_2]\)O^6^CMdG, 2 and 3. Hence this
research initially focussed on the synthesis of $^{2}$H$_2$- and $^{13}$C$_2$ethyl glycolate (4 and 5 (Scheme 2)) and subsequently that of 2 and 3.

Experimental

General

All chemicals were purchased from Sigma-Aldrich (Dorset, UK) and used without further purification. Solvents were purchased from Fisher (Loughborough, UK). Organic extracts were dried over MgSO$_4$. NMR data where obtained on Bruker Avance 300 spectrometer at 300.1 MHz ($^1$H) or 75.5 MHz ($^{13}$C). Chemical shifts were determined relative to the residual solvent peak and reported as parts per million (ppm) and coupling constants in Hz. Reactions and purifications were monitored by HPLC on a Waters Alliance system equipped with a Waters 996 photodiode array detector with a narrow-bore Hypersil BDS C18 column (3 µm, 100 × 2.1 mm), flow rate 0.2 ml/min, MeOH/0.02 M ammonium acetate (pH 5.4) 80:20. ESI-MS spectra were recorded on VG Quattro mass spectrometer with a narrow-bore Hypersil BDS C18 column (3 µm, 100 × 2.1 mm), flow rate 0.2 ml/min and 0.1% formic acid/methanol gradient.

Glycine ethyl ester hydrochloride

Glycine (0.5 g, 6.66 mmol) was suspended in ethanol (15 cm$^3$) and acetyl chloride (1.5 cm$^3$, 21.12 mmol), and heated at 85° C for 30 mins under N$_2$. The solvents were removed to give a white powder (1.01 g, >100% yield). NMR (D$_2$O) δ$_H$ ppm 1.19 (3H, t, CH$_3$, $J$ = 7.14), 3.81 (2H, s, N-CH$_2$), 4.20 (2H, q, O-CH$_2$, $J$ = 7.14); δ$_C$ ppm 14.03 (CH$_3$), 41.05 (N-C), 64.16 (O-CH$_2$), 169.00 (C=O).

$^{[13]C}_2$Glycine ethyl ester hydrochloride

$^{[13]C}_2$Glycine (0.5 g, 6.49 mmol) was reacted as above to give a white powder (0.93 g, >100% yield). NMR (D$_2$O) δ$_H$ ppm 1.17 (3H, t, CH$_3$, $J$ = 7.14), 3.79 (2H, dd, N-CH$_2$, $J_{CH}$ = 145.64, 6.32), 4.19 (2H, dq, O-CH$_2$, $J_{HH}$ = 7.14, $J_{CH}$ = 2.94); δ$_C$ ppm 14.02 (CH$_3$), 41.02 (N-C, $d$, $J$ = 62.40), 64.15 (O-CH$_2$), 169.00 (C=O).

Ethyl diazoacetate

Glycine ethyl ester.HCl (0.99 g, 7.09 mmol) was dissolved in water (1.8 cm$^3$) and dichloromethane (4 cm$^3$), stirred and cooled to -10° C. Aq. sodium nitrite (4.43 M, 1.8 cm$^3$) was added to the cooled solution, then 5% H$_2$SO$_4$ (0.65 cm$^3$) was added dropwise and the solution stirred for 10 mins. The organic layer was poured into 5% NaCO$_3$ at 0° C. The aqueous layer was extracted with dichloromethane and the organic extract combined with the organic/NaCO$_3$ solutions. The combined solution was shaken thoroughly and the pH checked to ensure that it was alkaline. The solvents were removed to give 0.66 g of a pale yellow oil (5.78 mmol, 82% yield). NMR (CDCl$_3$) δ$_H$ ppm 1.21 (3H, t, CH$_3$, $J$ = 7.14 Hz), 4.15 (2H, q, CH$_2$, $J_{HH}$ = 7.14, $J_{CH}$ = 2.94), 4.75 (1H, d, CH, $J_{CH}$ = 259.05); δ$_C$ ppm 14.41 (CH$_3$), 46.12 (CH, $J$ = 96.84, 60.85 (CH$_2$), 166.86 (C=O).

$^{[13]C}_2$Ethyl diazoacetate

$^{[13]C}_2$Glycine ethyl ester.HCl (0.80 g, 5.65 mmol) was reacted as described above to give a pale yellow oil (0.36 g, 55% yield). NMR (CDCl$_3$) δ$_H$ ppm 1.21 (3H, t, CH$_3$, $J$ = 7.14), 4.15 (2H, dq, CH$_2$, $J_{HH}$ = 7.14, $J_{CH}$ = 3.30), 4.75 (1H, d, CH, $J_{CH}$ = 259.05); δ$_C$ ppm 14.41 (CH$_3$), 46.12 (CH, $J$ = 96.84), 60.85 (CH$_2$), 166.87 (C=O).
**Ethyl glycolate**

Ethyl diazoacetate (0.40 g, 3.49 mmol) was reacted as above substituting D₂O for H₂O, and d-αcetic acid for acetic acid to give a pale yellow oil (6.05 g, 59% yield). NMR (CDCl₃) δH ppm 1.28 (3H, t, CH₃), 3.83 (1H, m, 5'-H), 4.08 (2H, s, CH₂), 6.77 mmol) and dry triethylamine (3 cm³) with DMAP (0.03 g, 0.25 mmol) and methanesulfonyl chloride (1.00 g, 8.73 mmol), added dropwise and stirred for 3 h. Purification was carried out on silica (chloroform/methanol, 97:3) to give a yellow oil (0.24 g, 66% yield). NMR (CDCl₃) [δH ppm 1.23 (3H, t, CH₃, J = 7.14 Hz), 4.08 (2H, s, CH₂OH), 4.20 (2H, q, CH₂CH₃, J = 7.14); δC ppm 14.21 (CH₃), 53.32 (CH₂CH₃), 61.64 (CH₂OH), 173.42 (C=O)]

[¹H₂]Ethyl glycolate (4)

Ethyl diazoacetate (10 cm³, 96.41 mmol) was dissolved in dichloromethane (30 cm³) with 4-(dimethylamino)pyridine (DMAP) (0.024 g, 0.20 mmol) and stirred under N₂ for 16 h. NMR (CDCl₃) δH ppm 1.22 (3H, t, CH₃), 3.83 (1H, m, 5'-H), 4.08 (2H, s, CH₂), 6.77 mmol) and 1,8-Diazabicyclo[5.4.0]undec-7-ene (0.5 cm³) with quinuclidine HCl (1.0 g, 12.13 mmol) and stirred under N₂ for 16 h. NaHCO₃ (aq) was added to give pH 8 and stirred for 2 h. The solvent was removed and the precipitate collected, washed (H₂O) and dried to give a white powder (0.080 g, 6.2% overall yield).

Step (ii): The product of (i) (1.00 g, 2.45 mmol) was dissolved in dry dichloromethane (30 cm³) with DMAP (0.03 g, 0.25 mmol) and methanesulfonyl chloride (1.00 g, 8.73 mmol), triethylamine (3 cm³) was added dropwise and stirred for 3 h. Purification was carried out on silica (chloroform/methanol, 97:3) to give a yellow oil (1.86 g, 98% yield). NMR (CDCl₃) [δH ppm 1.23 (3H, t, CH₃, J = 7.14 Hz), 4.08 (2H, s, CH₂OH), 4.20 (2H, q, CH₂CH₃, J = 7.14); δC ppm 14.21 (CH₃), 53.40 (CH₂CH₃), 60.53 (CH₂OH, d, J = 58.93), 173.32 (C=O, d, J = 58.93)]

**O⁶-[1-azonia-bicyclo[2.2.2]octane]-3',5'-bis-O-(isobutyryloxy)-2'-deoxyguanosine**

**O⁶-Carboxymethyl-2'-deoxyguanosine. Na (1)**

Step (iv): The product from (iii) was dissolved in dry dichloromethane (20 cm³). Methyl glycolate (0.5 cm³, 6.48 mmol) and 1,8-Diazabicyclo[5.4.0]undec-7-ene (0.5 cm³, 3.35 mmol) were added and stirred for 16 h. The solvents were removed and the resulting oil purified on silica (methanol/dichloromethane, 5:95) to give a yellow oil (1.60 g). Step (v): the oil was dissolved in methanol (20 cm³) with triethylamine (1 cm³) and stirred for 72 h. The solvents were removed to give a yellow oil (1.67 g) which was purified on a Supelclean Envi-18 6 ml column (Supelco, USA) pre-conditioned with methanol (2 cm³), then H₂O (2 cm³). The sample was applied to the column in H₂O (0.5 cm³), eluted, washed with H₂O (2 cm³), then 5% methanol / 95% H₂O (2 cm³). The pure fractions were lyophilised to give a slightly yellow powder (0.075 g). Step (vi): the powder was dissolved in 0.1 M NaOH (4.4 cm³) and stirred for 4 h, then lyophilised to give I as a white powder (0.080 g, 6.2% overall yield). NMR (DMSO) δH ppm 2.21 (1H, m, 2'-H), 2.59 (1H, m, 2'-H), 3.53 (2H, m, 5'-H), 3.83 (1H, m, 4'-H), 4.37 (1H, m, 3'-H), 4.58 (2H, s, CH₂), 5.17 (1H, br, 5'-OH), 5.44 (1H, br, 3'-OH), 6.19 (1H, t, 1'-H, J = 6.27), 6.22 (2H, s, NH₂), 8.06 (1H, s, 8-H); δC ppm 39.49 (2'-C), 61.64 (5'-C), 64.86 (CH₃), 70.69 (3'-C), 82.70 (1'-C), 87.57 (4'-C), 114.37 (5-C), 137.23 (8-C), 153.45 (6-C), 159.60 (2-C), 160.74 (4-C), 170.40 (COOH); M⁺ 324
[\textsuperscript{\textit{\textit{H}}\textsubscript{2}}\textit{O}]\textsuperscript{6}\textsuperscript{-}Carboxymethyl-2'-deoxyguanosine.Na (2)

Steps (iv-vi) were performed as for 1 substituting \textbf{4} (1 cm\textsuperscript{3}, 10.37 mmol) for methyl glycolate, and D\textsubscript{2}O for H\textsubscript{2}O to give 2 as a white powder (83.4 mg, 6.4% overall yield). NMR (DMSO) \(\delta\) ppm 2.27 (1H, m, 2'-H), 2.65 (1H, m, 2'-H), 3.60 (2H, m, 5'-H), 3.89 (1H, m, 4'-H), 4.43 (1H, m, 3'-H), 5.19 (1H, br, 5'-OH), 5.45 (1H, br, 3'-OH), 6.27 (1H, t, 1'-H, J = 6.87), 6.34 (2H, s, NH\textsubscript{2}), 8.14 (1H, s, 8-H); \(\delta\text{C} \) ppm 35.42 (2'-C), 61.99 (5'-C), 68.41 (CD\textsubscript{2}), 70.85 (3'-C), 83.40 (1'-C), 87.82 (4'-C), 114.39 (5-C), 133.95 (8-C), 140.22 (6-C), 143.54 (2-C), 160.15 (4-C), 175.65 (COOH); \(\text{M} \) 326

\[\textsuperscript{\text{13}}\text{C}\]\textsuperscript{6}\textsuperscript{-}Carboxymethyl-2'-deoxyguanosine.Na (3)

Steps (iv-vi) were performed as for 1 substituting \textbf{5} (0.2 cm\textsuperscript{3}, 2.07 mmol) for methyl glycolate to give 3 as a white powder (3.5 mg, 0.52% overall yield). NMR (DMSO) \(\delta\) ppm 2.59 (2H, m, 2'-H), 3.57 (2H, m, 5'-H), 3.83 (1H, m, 4'-H), 4.37 (1H, dd, CH\textsubscript{2}, \(J = 3.83, 145.49\)), 5.07 (1H, br, 5'-OH), 5.30 (1H, br, 3'-OH), 6.18 (1H, t, 1'-H, J = 6.86), 6.30 (2H, s, NH\textsubscript{2}), 8.04 (1H, s, 8-H); \(\delta\text{C} \) ppm 36.90 (2'-C), 61.76 (5'-C), 64.98 (CH\textsubscript{2}, J = 54.19), 70.76 (3'-C), 82.75 (1'-C), 87.55 (4'-C), 114.43 (5-C), 137.07 (8-C), 153.42 (6-C), 159.57 (2-C), 160.95 (4-C), 169.39 (COOH, J = 54.19); \(\text{M} \) 326

Results and discussion

The synthesis of 1 was carried out with methyl glycolate and gave a lower overall yield (6.2%) than previously reported\cite{6} despite several attempts to improve yields at each stage. We then investigated the hydrolysis of ethyl diazoacetate to give ethyl glycolate in both aqueous and deuterated solvents (Scheme 2, step (iii)). As discussed later, the C-13 labelled ethyl glycolate was subsequently required; hence the procedure was extended to give ethyl glycolate from glycine (Scheme 2). Kresge and Popik had shown that the hydrolysis of diazoketones took place in both water and deuterium oxide to give the corresponding alcohol\cite{7}. Whilst they found that the reactions took place at different rates according to the structure of the diazoketone, single products were acquired in high yield. We found that the hydrolysis of ethyl diazoacetate proceeded well under both conditions and with no substantial difference in the yields. The NMR for the unlabelled compound showed a singlet for the CH\textsubscript{2}-OH protons at 4.1 ppm that was not present in 4 confirming that the diazo group was converted to the alcohol with 100% incorporation of deuterium at the \(\alpha\)-carbon. Subsequently 4 was used to give 2 (Scheme 1) in a low overall yield (6.4%) which was comparable with 1. Deuterium-proton exchange was evident in 2 as the NMR revealed protons at the CH\textsubscript{2} position (17%) of the carboxymethyl group which had not been present in 4. This was improved by performing the final step in D\textsubscript{2}O (11%) but it is not known whether the exchange occurred during the synthesis or purification of 2. However, the NMR spectra of intermediates suggest that some exchange was occurring at each stage. Furthermore, the use of the 2 in LC-MS revealed additional deuterium-proton exchange resulting in peaks in the mass spectrum corresponding to single and di-deuterated compounds. Hence, a C-13 labelled O\textsuperscript{6}CMdG standard (3) was required for use as a stable LC-MS standard.

\[\textsuperscript{\text{13}}\text{C}\]Glycine was converted to the ethyl ester by reaction with acyl chloride rather than an acid/ethanol reflux which had given lower yields in initial attempts (data not shown). The conversion to \[\textsuperscript{\text{13}}\text{C}\]ethyl diazoacetate was performed by a known procedure\cite{8}, and converted to 5 in the same manner as for 4. The major difference in the NMR, between the labelled and unlabelled compounds, was either the lack of a peak or the very large coupling constants observed between protons and the C-13 atoms in the labelled compounds which enabled unambiguous assignment of the NMR spectra. The C-13 labelled compounds had peaks for the \(\alpha\)-H that showed splitting due to coupling to the two C-13 atoms with the exception of \[\textsuperscript{\text{13}}\text{C}\]ethyl diazoacetate. This compound had broader peaks than the other compounds,

http://mc.manuscriptcentral.com/jlcr
possibly due to the diazo group charge distribution, which did not allow observation of the splitting due to coupling with the carbonyl C-13 as well as the α-C. The synthesis of 3 was then performed in the same manner as for 2, and the double splitting pattern of the α-H was observed. However, for 3, the limiting factor was the quantity of 5 that was available due to the high cost of the material. Hence, yields for intermediates of Scheme 1 (steps (iv-vi)) of 3 were expected to be much lower and the purification was more difficult due to the high quantity of unreacted precursors. Nevertheless, sufficient pure material was obtained (0.52% yield) for use as an internal standard and the problem of deuterium-proton exchange had been overcome.

Conclusion
Both of the labelled ethyl glycolates, 4 and 5, were obtained in high yield. However, when 4 was used to synthesise 2, some deuterium-proton exchange was observed. This was exacerbated when LC-MS analysis was attempted. The synthesis of 5 did not pose any major problems but this compound then became the limiting factor in the synthesis of 3. In terms of cost, 2 was the preferred option but proved to be problematic for LC-MS analysis. Thus, 5, the C-13 labelled analogue of O6CMdG was obtained in sufficient yield for future analyses of biological samples by LC-MS.
