Chiral HPLC analysis

Chiral HPLC analyses were performed used the equipment described in the manuscript. Separation was obtained on a CHIRALPAK® AD-H column (250 × 4.6 mm, 5 µm) from Daicel Chemical Industries, Ltd. (Cedex, France). An isocratic mobile phase consisting of 9:1, 2-propanol: *n*-hexane was used. Powdered AL-LAD and LSZ, and LSZ reference material was dissolved individually in the isocratic mobile phase and diluted to a final concentration of 0.1 mg/mL. LSZ blotter was dissolved and extracted into the isocratic mobile phase following the procedure described in the manuscript. Injection volume was 10 µL, flow rate was 0.3 mL/min, and the column temperature was set at 25 °C. The total run time was 30 minutes.
